

ZZUtils

Save time. Save money.
Improve your applications.

ZZUtils is a set of over a dozen utilities designed to improve the productivity of Natural developers by complementing Natural's feature-rich toolset.

ZZTDOC, a component of **ZZUtils**, automates the creation of documents used in technical source code walkthroughs. The code walkthrough is a tremendous quality assurance tool, helping to improve code quality through the enforcement of coding standards, improve application performance through the review of database accesses and questionable code, and improve developer performance through the discussion of alternate methods and techniques.

To ensure the success of a walkthrough, the documentation must be accurate, consistent, simple to use, and easy to distribute. The creation procedure should allow for new module listings, source comparisons, sample report output, and various module types, including Natural, JCL, and COBOL. All source modifications should be highlighted for quick recognition. Manual processes are time-consuming, tedious, and error-prone, but through automation **ZZTDOC** eliminates the errors, the tedium, and 90% of the effort, offering a rapid return on investment.
